Greatest fixed points of probabilistic min/max polynomial equations, and reachability for branching Markov decision processes. (English) [Zbl 1394.60085](#)
Inf. Comput. 261, Part 2, 355-382 (2018).

Summary: We give polynomial time algorithms for quantitative (and qualitative) reachability analysis for branching Markov decision processes (BMDPs). Specifically, given a BMDP, and given an initial population, where the objective of the controller is to maximize (or minimize) the probability of eventually reaching a population that contains an object of a desired (or undesired) type, we give algorithms for approximating the supremum (infimum) reachability probability, within desired precision $\epsilon > 0$, in time polynomial in the encoding size of the BMDP and in $\log(1/\epsilon)$. We furthermore give P-time algorithms for computing ϵ -optimal strategies for both maximization and minimization of reachability probabilities. We also give P-time algorithms for all associated qualitative analysis problems, namely: deciding whether the optimal (supremum or infimum) reachability probabilities are 0 or 1. Prior to this paper, approximation of optimal reachability probabilities for BMDPs was not even known to be decidable.

Our algorithms exploit the following basic fact: we show that for any BMDP, its maximum (minimum) non-reachability probabilities are given by the greatest fixed point (GFP) solution $g^* \in [0,1]^n$ of a corresponding monotone max (min) probabilistic polynomial system of equations (max/minPPS), $x = P(x)$, which are the Bellman optimality equations for a BMDP with non-reachability objectives. We show how to compute the GFP of max/minPPSs to desired precision in P-time.

We also study more general *branching simple stochastic games* (BSSGs) with (non-)reachability objectives. We show that: (1) the value of these games is captured by the GFP, g^* , of a corresponding max-minPPS, $x = P(x)$; (2) the *quantitative* problem of approximating the value is in TFNP; and (3) the *qualitative* problems associated with the value are all solvable in P-time.
