Termination detection for active objects. (English) Zbl 1243.68221

J. Log. Algebr. Program. 81, No. 4, 541-557 (2012).

Summary: We investigate deadlock detection for a modeling language based on active objects. To detect deadlock in an actor-like subset of Creol we focus on the communication between the active objects. For the analysis of the model we translate a Creol configuration to a process algebra featuring the Linda coordination primitives. The translation preserves the deadlock behaviour of the model and allows us to apply a formalism introduced by *N. Busi*, *R. Gorrieri* and *G. Zavattaro* [Inf. Comput. 156, No. 1-2, 90-121 (2000; [Zbl 1046.68616](#))] to detect global deadlocks in the process algebra.
